

T4 construction: complete arc ledger and four-OD pulse

1,811,888 arcs | 4 commodities | total q = 0.04502754845 PCE

30 s per step; departure at step 5 (08:02:30); H = 117 steps (58.5 min after 08:00).

q = hourly Stage-3 demand / 12. This is a synthetic engineering pulse, not observed departures.

- OD 1 42003151700 → 42003980500
- OD 2 42003151700 → 42003050100
- OD 3 42003050600 → 42003050100
- OD 4 42003562901 → 42003151600

Physical roads: ≥1 step, original free-flow cost, capacity = hourly PCE / 120.
Turns: zero time, 10⁻⁵-minute engineering epsilon, no independent road capacity.
Waiting: one step, 0.5-minute cost; no storage, FIFO, or queue dynamics.
Origin loading starts at OUT state; initial physical road is omitted. Sink jump is ledger bookkeeping.
